Netgear wgr614v9 default password

Need More Help? The NETGEAR WGR614 router is available in 10 different versions, but all of them use password as the default password. As with most passwords, this one is case sensitive. Every version of this router also uses the default username of admin. When asked for the WGR614 password, just enter that. Although the username and password are the same for each version of this router, the first five versions (1-5) have a default IP address of 192.168.0.1; versions 6 and newer use 192.168.1.1. Netgear If password doesn't work when you log in, then it's been changed at some point to something else. Changing the default password of any device, including the WGR614, is an important security practice. The downside is that it's easy to forget. Reset the NETGEAR WGR614 router to restore the username and password to the factory defaults: Plug in the power cable and turn on the router. Turn the device around to access to the back panel, where the cables are plugged in. Look for the Reset button. If you don't see this button, check the bottom. Different routers have it located in different places. Firmly press the Reset button with something small and pointed, such as a paperclip or pencil, for 10 seconds. Wait for the router to reset. This may take between 30 and 60 seconds. Unplug the power cable. Then, reattach it after a few seconds to reboot the router. Wait 30 to 60 seconds for it to boot up. The router is now reset. Log in with the default username and password of admin and password. The IP address you use to access the login page will be different depending on the WGR614 version you have. Resetting to factory defaults resets every customization you made. If you had custom DNS servers, a wireless network, or port forwards, re-enter that information, which might involve configuring the DNS settings again, setting up an SSID and wireless password, and forwarding the ports. Check "Configuration File Management" in the WGR614 router user manual (links below) for instructions on backing up settings. If the default IP address doesn't give you access to the router, it most likely means that it was changed at some point. To find the correct address, you want to locate the default gateway IP using any device that's connected to the router. When you reset the WGR614, the default password is reinstated, too, not just the password. If you followed the steps above to reset the router, access the router with the default IP address. You shouldn't need to find the default gateway. Every resource NETGEAR has on the WGR614 router is available on the WGR614 Support page. If you need the support page for a different version of this router, pick the right version from the Select a different version dropdown menu on that page. No matter which version you use, download the most recent firmware in the Downloads section. When downloading firmware, select the one that corresponds to the same hardware version of your WGR614. Installing the wrong firmware can cause problems with the router functionality. Here are direct links to the WGR614 manual for each version of this router: These NETGEAR WGR614 user manuals are in the PDF format, so you'll need a PDF reader to open them. The WGR614v4 manual is also a PDF, but it's stored in a ZIP file. Thanks for letting us know! Tell us why! An important aspect of having a Netgear router on your home network is internet security. To help with confusion, we have simplified this step for you with this link: Login to your WGR614v9 Router Once you have opened a web browser, find the address bar which is usually located at the top of the screen. The image below shows an example of this. Browser address bar Above is an example of what a web browser address bar looks like. Find the address bar in your web browser and type in your router's IP address. The Netgear WGR614v9 router's default IP address is: 192.168.1.1 Once you have finished entering your router's IP address into the address bar, click the enter button on your keyboard. A box similar to the one below should appear. Enter the username and password for the Netgear WGR614v9 in the corresponding boxes. Important Note: If you have changed them in the past, you need to enter in those values. The default Netgear WGR614v9 Router Username is: admin The default Netgear WGR614v9 Router Password is: password To log in to your Netgear WGR614v9 router, enter your username and password, and then click the Log In button. If the username and password did not work I recommend checking out our Default Netgear Router Passwords page. If, after trying the above list of passwords you still can't login you may need to consider a reset for your router. Learn how to do that by reading our How to Reset a Router guide. After resetting the Netgear WGR614v9 router your username and password are reverted back to factory defaults. Step 3 After a successful login to the Netgear WGR614v9 router you should be on the home page of your router. Now you need to find the Port Forwarding section. This is the home page from your Netgear router. Click on the Port Forwarding / Port Triggering link, which is at the left of the screen. You should now be on a page called Port Forwarding / Port Triggering. This is the port forwarding page from your Netgear router. Step 4 Make sure that you must open a port in your router before doing so since this will allow data to come through the firewall portion of your router to a specific device. It is possible that this could lead to malicious traffic on your network. However, don't let this warning stop you from making this change if you need it because the risk is very low. Here are the ports to forward for Xbox Live: TCP Ports: 3074 UDP Ports: 3074 If you are looking for the ports for a different application you can find it by either: Make sure there's a dot next to Port Forwarding, then click on the Add Custom Service button. Put a name for this forward in the Service Name box so that you can remember why you set this forward up. The name does not matter, so pick something that has meaning to you. Select the protocol type of the ports that you are forwarding from the Service Type dropdown box. If your router has the option of Both, then go ahead and select that. Otherwise, select either TCP or UDP as needed. If you need to forward a port for both TCP and UDP, but your router does not have Both, then you will need to create two entries. Enter the port number into the Starting Port and the Ending Port boxes to forward a single port. If you are forwarding a range of ports, enter the lowest number of that range into the Starting Port box and then enter the highest number of that range into the Ending Port box. Go ahead and enter the IP address that you are forwarding ports to into the Server IP Address box. It is possible for this to be either the IP address of your computer or of any other device on your network that you want ports forwarded to. When you are completely finished, click the Apply button at the bottom of the page to apply these changes. Test If Your Ports Are Open Finally, I strongly recommend testing to see if you forwarded the Netgear WGR614v9 ports correctly. To do this you can use our Network Utilities tool, which includes a free Open Port Checker. Open Port Checker is the only online port checking tool that has Guaranteed Results.
